## 1. INTRODUCTION

This user manual relates to complete personal respiratory protection with accompanying compressed air line, as specified in EN 14594:2018 class 4B. Complete personal respiratory protection includes:

**Blastsafe™ ORIGIN** - helmet for abrasive blasting, with full hood.

## 2. PURPOSE AND APPLICATIONS

The equipment is for use in working environments where the respiratory organs, face and head need protecting from ricocheting media, particulate matter, dust, steam or fumes and gases. When the sandblaster's helmet is connected to a compressed air system via the compressed air line, air flows out through the air channel into the front of the helmet. The air exits the helmet at the neck. The required through-flow of air can be adjusted by means of the regulator. The integral air flow indicator shows whether sufficient air is flowing into the helmet. Both inner and outer visors are easily replaceable when worn or damaged. The front cover of the visor frame is opened to replace these. The integral "earmuffs" protect the user's hearing against noise (*Fig. 4.2*).

### 2.1. Restrictions on use

- 2.1.1. The equipment is not suitable for use in areas with: intense heat radiation, open flame, explosive potential or whenever there is an high concentration of hazardous substances, or highly toxic atmospheres, thereby creating an immediate risk to health.
- 2.1.2. If the room temperature is below freezing point, moisture in the compressed air circuit can lead to the formation of ice in the coupling or regulator, thereby stopping the continued supply of air. In such cases it is necessary to establish that the humidity of the compressed air (at atmospheric pressure) is less than 50 mg/m<sup>3</sup>. This in accordance to EN 12021.
- 2.1.3. Before using the equipment for the first time, the user must practise taking the equipment off quickly.
- 2.1.4. Make sure that the breathing air is in accordance with EN12021.
- 2.1.5. It is not permitted to use oxygen or oxygenated air.
- 2.1.6. Connections and line couplings must be kept clean during connection and disconnection.

- 2.1.7. Every user connected to the air supply system shall check that the capacity of the air supply system is sufficient for himself in accordance with the information supplied by the manufacturer.
- 2.1.8. The donning process shall be carried out strictly in accordance to the information supplied by the manufacturer found in the user manual.
- 2.1.9. "Were appropriate the, marking "f" indicates that the RPD and the compressed air supply tube can be used in situations where exposed to flame can be a risk".
- 2.1.10. When connecting the RPD to air supply pipes only beathing air couplings shall be used.
- 2.1.11. During very strenuous work, it is possible that negative pressure will temporarily arise in the hood, which will result in a reduction of the equipment's protective factor.
- 2.1.12. Air speeds above 2 m/s can affect the equipment's protective factor.
- 2.1.13. When using compressed air for both the hood and compressed air tools (e.g. spray painting), it needs to be ensured that the flow of air to the hood is sufficient when the air being consumed by the compressed air tools is at its peak. If necessary, the working pressure can be altered.
- 2.1.14. The equipment must only be used by skilled operatives who are also fully aware of the hazards that may arise as a result of the work being carried out.
- 2.1.15. The respiratory helmet has not been tested for compliance with EN 397.
- 2.1.16. The equipment provides acoustic attenuation (soundproofing) to 42 dB(A). In some cases the attenuation value may be reduced owing to a less than optimal seal between head and "earmuffs" (due to hair growth, glasses, goggles etc.).
- 2.1.17. The use of earplugs is recommended in addition to the integral hearing protection devices.
- 2.1.18. No air line longer than 50m must be used (total from compressor to mask) and with a maximum of 3 lines interconnected.

### 3. BEFORE FIRST-TIME USE

The equipment is supplied partly assembled. Before use, loose parts must be assembled following the assembly instructions carefully. If any uncertainty arises with regard to assembly, please contact Silencer AS before putting the equipment into service.

#### 3.1. Fitting instructions

Note: Numbers in brackets refer to the Figure and Assembly numbers.

- 3.1.1. Adjust the "earmuffs"/ earmuffs (*Fig 4.2*) to approximately the right length by

pushing them up or down.

- 3.1.2. Press the "earmuffs" out carefully to the side until a "click" is heard (*Fig.4.3*). Place the helmet on the head (*fig. 7.3*). Press the "earmuffs" in towards the head until a "click" is heard. Place one hand halfway up the helmet, guiding the other hand up between hood and "CAPE top" (*fig. 7.4*). Locate one ear defender and pull it up/down until it is in the correct position. Do the same thing on the other side.
- 3.1.3. Adjust the head-strap (*Fig. 4.4*) until the helmet is secure and comfortable.
- 3.1.4. Secure line with regulator, filters, coupling and belt to the "CAPE top" by pulling the belt into the sheaths (*fig. 7.5*). Take care that the regulator is located centrally at the rear and is facing out from the "CAPE top".
- 3.1.5. Secure the bayonet fitting (*Fig.6*) to the bayonet fitting mounted on the helmet shell (*item6 - assembly 9*).
- 3.1.6. Carry out maintenance in accordance with paragraphs 6 and 7.

## 4. USAGE

### 4.1. Before use (*ref. Fig. 2.1 - 7.3*)

Check that the compressor has been turned on and set to the correct pressure. (A worn and/or dirty compressor will produce contaminated air, which can be purified using a filter panel.) Inspect to see that the compressor cannot suck hazardous substances in through the air intake. Check that all components have been cleaned and inspected as described in paragraphs 5 and 6. Adjust the working pressure to a minimum 5 bar. Hook up the sandblaster's helmet to the compressed air system via the compressed air line. Adjust the head-strap to the correct size. Adjust "earmuffs" to correct length by pushing them up or down, as they may have dislodged when the hood was last taken off. Carefully press "earmuffs" out to the side until a "click" is heard. Place the helmet on the head. Guide the hands up between hood and "CAPE top". Press "earmuffs" in against the head until a "click" is heard. Adjust "earmuffs" so that they surround the ears as far as possible in order to achieve the best soundproofing possible. Guide the hands in under the "CAPE top" and close the neck by tightening the band in order to ensure sufficient pressure inside the air hood. Fasten the belt buckle.

### 4.2. During use

#### 4.2.1. Airflow

Adjust air flow as required. The integral air flow indicator warns the user if the air supply is inadequate. The air flow indicator has been installed so that the orange pennant is not visible when there is a sufficient through-flow of air. It

will only work optimally when positioned vertically, and will seem rather sluggish if the head is angled far forward or to either side. For safety reasons the regulator cannot be shut off altogether. Leave the work area immediately if any break occurs in the air supply. Check that the compressed air line cannot possibly be lodged in such a way as to disrupt the air supply or prevent the person leaving the work area quickly. The integral hearing protection will reduce the general level of noise, but the additional use of earplugs is recommended.

#### 4.2.2. Indicator

If the Air Flow Indicator falls down during operation, which indicates to low airflow, the operator must remove the helmet from the head. Control and establish the correct airflow and make sure the indicator is placed in the hidden position by pushing the indicator in. The helmet is now serviced for further use.

#### 4.1. After use

After leaving the work area, release the belt buckle, loosen the band at the neck, take off the helmet and disconnect the air supply line. Use a brush or a rag to remove loose remains and dirt or grime from components. Clean and inspect in accordance with instructions described in paragraphs 5 and 6. When connecting and disconnecting, be careful not to allow any contamination into the open coupling.

### 5. CLEANING

After every work session, clean helmet, hood and "CAPE top" using a mixture of water and mild synthetic detergent. Do not use any form of solvent. The textile part can be machine washed at 30 degrees Celsius using a mild washing powder. Use a disinfectant to clean the internal surfaces of the helmet. Follow the instructions issued by the disinfectant manufacturer. For reasons of hygiene, the equipment should only be used by the same person. Blast the coupling and regulator clean with compressed air. Finally, use a dry cloth to dry all metal parts in order to avoid corrosion. When cleaning, be vigilant not to breathe in any harmful substances generated during cleaning.

## 6. MAINTENANCE AND INSPECTION

#### 6.1. Replace "wire mesh" (fig.5.4-6) (item2, Assembly 2) and "outer glass" (fig.5.4-6) (item 1, Assembly 2)

Lean the head forward until the visor is in a roughly horizontal position. Open the "outer frame" with one hand and remove the "wire mesh"/"outer glass" with the other hand. Fit a new "outer glass" onto the "wire mesh". (If necessary, replace the "wire mesh".) Lean the head forward into a roughly horizontal position again.

Place the "outer glass" with mesh into the "outer frame" (with the "wire mesh" on the outside). Close the "outer frame" while holding the "wire mesh"/ glass in place with your thumb, for example. Check that the "visor frame" "elastic band" is properly secured (Fig. 3.1).

#### 6.2. Replace safety glass and safety gasket (fig. 8.2-8.3)

Push the safety glass into the "safety glass seal/gasket" (Fig. 8.3). Then push the gasket, complete with glass, into the visor frame (Fig. 8.2). Take care that the two vertical mounting edges face inwards and surround the edge of the visor opening. Press the gasket home firmly. Position the "outer glass" on the "gasket". Place the "wire mesh" onto the "outer glass". Close the "visor frame" cover and secure the "visor frame" with "elastic band" locked on the "hook" (Fig. 8.0). Check that the "visor frame" cover is locked in position (fig. 3.1).

#### 6.3. Replace "CAPE top" (Assembly 1 and and 4)

Remove "wire mesh", "outer glass", "inner safety glass", "safety glass seal", "outer frame" as described in paragraph 6.1 and 6.2.

Loosen/ remove 2 screws on the top of the helmet shell (Item 1, Assembly 4). Keep the 2 washers. This will loosen the "head band assembly" (Item 2, Assembly 4). Loosen 3 screws at the front of the helmet shell, 2 screws at the back of the helmet shell, 2 screws on each side of the visor and 1 for the elastic hook (Item 3, Assembly 1). Remove and keep all screws and nuts for assembly. (Note: Mind screws, "plastic nuts" and washers; these need to be fitted in the same position when re-assembled.) Once all the screws and nuts have been removed (12sets in total), the helmet shell can be separated from the "inner shell" (Item 1, Assembly 1), thereby releasing the ""CAPE top" top" (Item 7, Assembly 1). Place a new ""CAPE top" top" over the "Soft inner shell". Lay the round band in the ""CAPE top" top" around along the countersink in the "Soft inner shell". Take care that the shallow countersink on the "CAPE top" is located at the front of the "Soft inner shell". Adjust the "CAPE top" so that the joining seams on either side of the "CAPE top" are positioned centrally above the ear area in the "Soft inner shell". Check that the "CAPE top" is correctly positioned. [Note: If desired, the "CAPE top" can be taped securely to the "Soft inner shell". Press the helmet shell down over the "Soft inner shell" so as to lock the round band in the "CAPE top" in the channel formed between the "Soft inner shell" and the helmet shell. Straighten the "CAPE top" so that it is evenly distributed around the edge. Take care that the round band does not slip out of the channel.

Squeeze the helmet shell and "Soft inner shell" together firmly and press 2 "plastic nuts" in through the helmet shell and "Soft inner shell" at the back, screwing in the screw (Note. The plastic screws have a limit of 1Nm Torque, they break easily, so be careful, Ref. Assembly 1). Press 2 "plastic nuts" in through the "helmet shell" and "Soft inner shell" at the front and screw in the screws. Fit the "earmuffs".

#### 6.4. Regulator Maintenance (air flow)

Lubricator used on the seals in the Air Flow Regulator can under some condition harden. This might cause air leakage, or the regulator might be difficult to operate. If this condition occurs, dismantle the regulator, clean and lubricate the O-rings with approved lubrication for O-rings. Or get the valve serviced at your Distributor. (*Assembly3*)

### 7. After replacing parts, conduct a function test

#### 7.1. Function test

After cleaning, disinfecting or replacing components, check that the system is functioning, inspect all essential parts for damage or contamination and, if required, replace with original spares. If the orange pennant on the air flow indicator displays insufficient air supply in the hood even though the pressure is correctly adjusted, this may indicate that a blockage has occurred in the filter system, the compressed air line, the couplings or the soundproofing. During this check, hold the helmet in the vertical position (normal working position). Checking the line system for leakage Carry out manual testing by pulling on the coupling and air supply line. Connect the equipment to the compressed air supply via the compressed air line. Inspect to see that no leakage sounds are coming from the air supply and/or compressed air line.

## 8. MAINTENANCE ROUTINES

### 8.1.1. Before use:

Function and leakage inspection

### 8.1.2. After use:

Cleaning and disinfection of equipment: cleaning, function check and leakage inspection of complete equipment

### 8.1.1. Every 6 months:

Cleaning and disinfection of equipment: cleaning, function check and leakage inspection of complete equipment, as well as O-ring replacement in bayonet fittings.

## 9. STORAGE

After use and cleaning, store the equipment in a cool, dry, dark place. Make sure you prevent components and parts of the equipment coming into contact with oil, grease, solvents, acid sand other chemicals. The protective mask can be stored for two years in this way without deteriorating in quality.

## 10. SPARE PARTS

List of spare parts is available at the following URL:

## 12. MANDATORY REQUIREMENTS AND REGULATIONS

- 12.1. FOR 1994-08-19 no. 819: Regulation on construction, design and production of personal protective equipment (PPE). This regulation is equivalent to 89/686/EEC Standard EN 14594:2018 class 4B: Personal respiratory protection
- 12.2. Approval of equipment: Intercert Global Sp.zo.o.
- 12.3. Product inspection as per Module B+C2. 13: Intercert Global Sp.zo.o.
- 12.4. Equipment labelling: Label at the back of the hood/"CAPE top".

## 13. GENERAL

Silencer AS, is continually working to improve its products and is at liberty to alter the specifications given in this manual without prior warning. Purchases of our products are subject to our General Terms of Sale and Delivery.

### 13.1. Caution

Within the regulatory framework laid down in FOR 1994-08-19 No. 819: Norwegian Regulation on Construction, Design and Production of Personal Protective Equipment (PPE), only approved and correctly CE-marked PPE can be marketed and used. Where non-original parts are used, CE approval will be invalidated in addition to all rights flowing from the guarantee. Only spare parts supplied by Silencer AS must be used.

**Intercert Global Sp.zo.o.** NB2957 authorised body, has taken part in the CE type approval in accordance with EN 14594:2018 Class 4B.
